Abstract

**Introduction:** It was surprising that the prevalence of pornography addiction in our conservative religious society is increasing, that is why we decided to start studying it.

**Aim:** Was to assess the prevalence of pornography addiction among married patients and to study the possible interaction between pornography addiction and male sexual function.

**Method:** The study included 616 male patients; 293 patients complaining of sexual dysfunction (G1) and 323 patients not complaining of sexual dysfunction (G2).

**Results:** There were (58.8%) of all patients using pornography materials (52.9% in G1 and 64.1% in G2). Between pornography users, (32.6%) were using pornography before marriage for masturbation and stopped using after marriage, (17.7%) patients were using pornography before marriage for masturbation and continue to use after marriage, and (8.4%) patients start to use pornography after marriage or after development of the sexual dysfunction.
