An abstract of a study about:

The occupational interference by using life pattern from the respective of general practicing of social work and enabling the mother to face negative impressions which come from her child infection of cancer disease.

Prepared by

Professor: Mervat El Sayed Khateri Ibrahim

A teacher in the department of social work fields in
Fayoum

First: study objectives:

The study aims to achieve the following:

١-Testing the relationship between using life pattern from the respect of general practicing of social work and enabling the mother to face negative impressions which come from her child infection of cancer disease.

٢-Rationing a program for occupational interference from the respect of general practicing to face mother's negative impressions which come from her child infection of cancer disease after testing it.

Second: study assumptions:

The study tries to test the following main assumption:

There is a relationship with statistical sign between The occupational interference by using life pattern and enabling the mother to face negative impressions which come from her child infection of cancer disease.

The following sub-assumptions emanate from the main assumption.

١- There is a relationship with statistical sign between

The occupational interference by using life pattern and facing the negative impressions which lead to confusing mother's adaptation abilities with her child infection of cancer disease.

٢-There is a relationship with statistical sign between

The occupational interference by using life pattern and facing the negative impressions which obstruct the mother from doing her role towards her child and family.

٣-There is a relationship with statistical sign between

The occupational interference by using life pattern and facing the negative impressions which lead to mother's social isolation.

Third: study's methodical procedures:

١-type of the study: this study considered one of occupational interference studies in social work to evaluate occupational interference outcomes.

٢-tools of the study: a measurement (to measure the mother's negative impressions as a result from her child infection of cancer disease.

٣-fields of the study:

(a)spatial field: Naser institute hospital in cairo.

(b)human field: (١٠)mothers from Naser institute as an experimental group. (١٠)mothers from tumors institute as a control group.

(c) time field: The occupational interference lasts for four months from(١-١٢-٢٠٠٤) until (٣٠-٣-٢٠٠٥).

Fourth: results of the study:

The study results reached that The occupational interference by using life pattern from the respective of general practicing of social work leaded to enabling the mother from facing the negative impressions which come from her child infection of cancer disease by facing the negative impressions which disable her ability on adaptation with this situation, as well facing the negative impressions which disable her from doing her role in taking care of her child and her family besides facing the results which lead to her isolation and work on increasing her social relationships.
