### **Research Summary:-**

Art is no longer painting or drawing, or three-dimensional sculptures, but beyond that to be one of the recognized therapeutic methods at the local and global level, has described the American Association for the treatment of plastic art this kind of treatment that uses and usability of therapeutic artistic production by creating art and reflecting on production and operations. Individuals can raise their awareness of themselves and others cope with their symptoms, stress and nervousness, and the trauma they experience in their lives, achieving a balanced and mentally balanced life. This new type of treatment has achieved effective results with many diseases. Psychological and organic, art works to determine the relationship between the individual and the artistic activity that the child cares about and thus grows the scope of communication to the surrounding environment, whether objects or individuals in the environment itself.

Art activities are therefore one of the most important activities for autistic children because they help them to develop their visual perception by developing their visual perception through the sense of color, line, distance, size and perception of touch by drawing and touching the surfaces.

Therefore, the treatment of art through environmental fees because it is a successful means in the treatment of various disorders suffered by many people with special needs, including autistic children as it is a fundamental part of the programs of development of communication skills and social children with special needs.

Art is therefore the successful medium in treating the various disorders experienced by many individuals. It is also an essential part of the skills development programs for children with special needs, and of course autistic children.

The treatment of drawing is of great importance to people with autism disorder because it helps to express the emotional and expressive feelings of the child through the development of human interaction between him and the work of art and therapist, and works to develop the child's self-awareness and make it able to produce a beautiful and distinctive work, and helps to develop the sense of the child himself. So as to grow his sense of the environment around him, and enriches the routine style of routine followed by autistic in drawing and makes their style more flexible and so illustrated through drawing and playing in color, the extent of the child's social compatibility and desires and emotional problems and projections of the unconscious that appear in the drawing and which drives the child who has to unite to draw, and through it the child learns a lot of ways to communicate with the environment through painting, On this quest here is to add and enrich this approach, rather than remaining only add some kind of treatment.

Accordingly, the researcher has formulated the following problem:

How can the environmental fees of sight yes contribute to the treatment of communication in children of autism.
