SUMMARY

The formation capabilities of wrapping spaces among the woven areas as an introduction for achieving plasticism values on the surface of the fabricated woven.

The study formed from five chapters contained both theoretical and experimental frames. It was on the

She carried out the statistical treatments, results analysis and discussion in the light of both theoretical and experimental frames then extraction the most important results of the research. Among the most important results is the aestheticism and plasticism values of the wrap if it appeared without weldings between textile areas. Then the researcher recommended many recommendations according to her study.
