"A Counseling Program for Enhancing the small Project Management Skills of the Students in the Industrial–Technical Schooling and Its Relation to the Social Interaction Patterns"

- **The current research aims** : to enhance the awareness of the small project skills of the students in the industrial–technical schooling and its relation to the social interaction patterns. Both the Analytical Descriptive and the Experimental approaches were used in the study. 200 participants (male and female) were recruited from the industrial and technical schools in Fayoum Governorate. Results showed that the awareness of the small project management skills varied according to gender, place of living, age of the students, parents' education, parents' profession, family size and family income. In addition, the scores of the awareness of the small project management skills correlated with the scores of the social interaction pattern scale. Interestingly, contribution of the independent variables like the father education, mother education, father profession and age to the awareness of the small project management skills were (70.9% , 62.6% , 57.8% , and 51.6% respectively). On the other hand, the contribution of the independent variables like the mother's profession, the father's education and the father's profession to

the social interaction patterns were (79.5% , 66.5% , 60.3% 55.5% respectively).

Importantly, results supported the efficacy of the counseling program to enhance the awareness of the small project management skills of the students as shown by the significant statistical differences between means of the experimental group in the pre and post tests. ($P \leq .01$).

50 students (male and female) were selected for the experimental group. Tools of the study included info sheet for the demographic variables of the sample families, info sheet for the students, the small project management skills awareness scale, the social interaction patterns of the industrial–technical schooling students and the counseling program.
