Current research aims to recognize the relationship between the family resource management efficiency and violence against the wife.

A sample formed from (208 reproducers wives who have a child or more in various stages of education were selected in a prejudice way of the clients at the maternity and childhood centers (health centers) in Cairo and Giza governorate and from different socio-economic levels.and apply public data Form ,Measures efficiency in family resource management,and violence against wife are used , the outputs resulted in:

1.The Most reactions from wives who were research sample to confront violence against her silence, tears43.3%, leave the house13.5%, comply with God and pray11.1%.
2. Wives who ask for help are 32.69% of the total sample, 66.2% of them resort to her relative to ask for help, followed by a friend from outside the family 13.2%.
3. There were statistically significant differences at the level of significance (0.01) in the wives efficiency in the family resource management (communication, decision-making and problem solving, income, time) and (Place of residence in favor of wives living in urban areas, the educational level of wife in favor of top-level , wife's work for the benefit of working wives, the profession of the wife of wives direction of higher vocational level owners, the duration of the marriage in the direction of 5 years to less than 10 years, the number of family members in the direction of less than 4 members, monthly income level in the direction of the high-income level) according to wives who are The research sample.
4.A negative correlation relationship function at the significance level of (0.05, 0.01) between (the causes of violence - the patterns of violence)directed against the wife and the efficiency of household resources dimensions Management (decision-making and problem-solving, communication, income, time) as perceived by research sample wives.
5.There are statistically significant differences (0.01) between the measure of

violence against wife and the variables of the study (Place of residence in favor of wives living in urban areas, the educational level of wife in favor of a low level, the wife's work for the benefit of the wives is employed,and who have lower professional level, duration of marriage in the direction of less than 5 years, the number of family members in the direction of 7 persons or more, the level of monthly income toward the low-income level) as perceived by the wives.research sample

6. Determine the contribution of the studied independent variables ratios (husband education, wife education, married life, wife career) with the dependent variable (efficiency in family resource management, violence against the wife) as perceived sample depending on the regression coefficients and linkage coefficients where the value (q) and values (T) function at (0.01).

7. There is a difference in the relative weights of the study variable (violence against the wife) was as follows (the causes of violence) economic reasons came in first place, wife character in the second place, and socio-cultural reasons in the third place, (the patterns of violence) economic violence came in first place, moral violence came in the second place, and third is physical violence, as well as a difference in the relative weights of the study variable (efficiency in family resource management), financial resource management came in the first place,   time management came came in the second place communication in the third place, decision-making and problem solving.
