

## **Abstract**

Vitiligo is a common acquired disorder of pigmentation that causes a tremendous impact on the quality of life in affected patients.

The treatment can be classified into medical treatment, light-based treatment, surgical treatment, and camouflage and depigmentation therapy.

Surgical treatments can be classified as procedures involving complete skin transfers (e.g., partial split-thickness grafting, punch grafting and blister grafting) and cell transplantations which are further divided into culture and non-culture techniques.

Cellular grafting includes, non-cultured epidermal cell suspension or transplantation, and epidermal and melanocyte cultures.

**Key words:** vitiligo- medical treatment-cell transplantation- non-cultured epidermal cell suspension- melanocyte cultures

## **Acknowledgement**

I wish to express my deepest gratitude to Prof. Dr. **Bakr El Zawahry**, Professor of dermatology, faculty of medicine, Cairo University for his kind support and supervision.

Also I am very grateful to Prof. Dr. **Amr Sharaf** Professor of dermatology, faculty of medicine, Cairo University for his great effort and indispensable help, it was by his continuous guidance that this work has come to light.

I would also like to thank Prof. Dr. **Hala Gabr** Professor of clinical pathology, faculty of medicine, Cairo University for her accurate, difficult work in this study.

Also, I would like to thank Prof. Dr. **Nagla Sameh** assistant Professor of dermatology, faculty of medicine, Cairo University, for her friendly attitude and kind supervision.

I would like also to express my thanks to Prof. Dr. **Rehab Sobhy** assistant Professor of dermatology, faculty of medicine, and to all my colleagues for their continuous support and cooperation.

**Finally** I would like to thank my family for their everlasting devotion, encouragement and patience
