

Psychosomatic effects of sexual harassment and violence on undergraduate university female students; a cross sectional prevalence study.

The prevalence of sexual harassment now days resemble a cancer due to its wide spread and diffusion within the societies and its profound effect on the well-being of the victim causing profound psychosomatic effects. These effects are affected by the method of harassment and the frequency of exposure. Families should have strong reflex against the perpetrator as this help the victim recovery and affects its profound effects on her well-being.
