بسم الله الرحمن الرحيم

السيد الأستاذ الدكتور/ رئيس قسم الميكروبيولوجى الطبيه والمناعة

تحية طيبة وبعد،

برجاء التكرم بالموافقة على مجمل أبحاثي العلمية لتقديمها للجنة العلمية الدائمة (الأساتذة والأساتذة المساعدين) للترقية لدرجة "أستاذ مساعد"؛

Research no 5

-Association Between miR-155, Its Polymorphism and Ischemia Modified Albumin in Patients with Rheumatoid Arthritis

Abstract

Rheumatoid arthritis (RA) is a chronic immune-mediated inflammatory disease. We aimed to measure the level of miR-155 and its genetic variant rs767649 in patients with RA and to evaluate their relationship with ischemia-modified albumin (IMA). The study was performed on 79 .(patients with RA (group I) and 78 healthy control participants (group II Quantitative real-time polymerase chain reaction was used to assess the expression of serum miR-155 in addition to its functional variant rs767649. IMA levels were measured by enzyme-linked immunosorbent assay. Significant overexpression of miR-155 and higher levels of IMA were detected in patients with RA compared with those in controls P<0.0001). The fold change in miR-155 was significantly positively) associated with IMA (r=0.362, P=0.001) in patients with RA. Significant differences in the frequency of miR-155 (rs767649) genotypes and alleles were noted between patients with RA and controls. MiR-155 and IMA levels were significantly associated with the genotype distribution of miR-155 (rs767649) in patients with RA and were higher in patients with the TT genotype. MiR-155 and its functional variant rs767649 might play an important role in susceptibility to the increased risk of RA, stressing the role of miR155 as a therapeutic target in the treatment of RA. In addition, IMA levels were increased and correlated with miR-155 and its .single nucleotide polymorphism rs767649 in Egyptian patients with RA
