

## **Deconstructive versus reconstructive endovascular approaches for intracranial dissecting aneurysms.**

Endovascular treatment today plays an important and central role in the overall management of patients with intracranial dissecting aneurysms. In most centers, endovascular treatment is the first-intention approach in the vast majority of patients.

Both treatment methods whether parent artery artery preserving technique showed favorable outcome which indicates the safety and efficacy of both approaches if selected properly according to the morphology of the aneurysm.
