

Anterolateral Versus Posterior Approach in Management of Lower Dorsal and Upper Lumbar Traumatic and Pathological Spine Fractures.

The lower thoracic and upper lumbar vertebrae are the most vulnerable sites for vertebral fractures

Medical history should be taken and patients should be thoroughly examined before an appropriate treatment plan can be drawn up. There isn't even

Now conclusive evidence necessitates the choice of a specific intervention for the treatment of these fractures. Anterior lateral intervention facilitates lifting Direct pressure on the spinal cord allows us to see directly the dura mater and allows us by restructuring and strengthening the anterior part of the vertebral body. While the back tackle is much easier

To fix the scoliosis of the spine and stabilize the three columns that make up the spine
